

BSCard

The BSCard component is designed to provide a styled container card within the BrightSpace Project.

Component Props

Prop Name	Type	Default Value	Description
children	React.ReactNode	—	The content to be rendered within the card.
givenCardStyle	string	—	Optional custom class name for overriding default styles.

Component Logic

1. **Style Determination:**
 - Uses makeStyles to define default card styles.
 - If givenCardStyle is provided, it overrides the default style; otherwise, the style from useStyles is applied.
2. **Rendering:**
 - Wraps the children prop in a Fluent UI Card component with the computed class name.
 - According to definition of <Card>, body content might be necessary.

Usage

Below is the usage for the BSCard component:

```
import BSCard from "../path/to/BSCard";

const MyComponent = () => (
  <BSCard>
    <p>This is some content inside the card.</p>
  </BSCard>
);
```
